Full-Stack Hardware Store Website
Self Project

Rahul Kumar, 23B1212

Project Overview

The Hardware Store Website is a full-stack web application consisting of two separate platforms: a user-facing website and an admin website. The system enables users to browse products, view featured and hot products, add items to a cart, place orders, and send messages to the administrator. The admin website allows the administrator to manage products, view incoming orders, and read customer messages. The entire application is designed to be fully responsive for laptop and mobile devices.

Aim

- To develop a full-stack hardware store website with separate user and admin interfaces.
- To implement a cart-based ordering system where user orders reach the admin dashboard.
- To provide featured and hot product sections for better product visibility.
- To enable communication between users and the administrator through messages.
- To ensure responsive design across laptops and mobile devices.

Design Functionality

```

Customer Website Interface

The user website allows customers to browse all available hardware products. Special sections such as Featured Products and Hot Products highlight important items. Users can add products to the cart, place orders, and send messages to the admin through a contact form.

Admin Website Interface

The admin website provides a dashboard to manage store operations. The administrator can add, update, and delete products. Orders placed by users are displayed in the admin order list. Messages sent from the user website are also visible on the admin panel.

Responsive Design

The website layout automatically adjusts based on screen size. CSS media queries and flexible layouts ensure smooth usability on both laptops and mobile devices.

Table 1: Key Features of the Hardware Store Website

Module	Description
User Website	Product browsing, cart, orders, featured products, messaging
Admin Website	Product management, order list, message handling
Cart System	Add/remove products and place orders
Responsive Design	Optimized for laptop and mobile devices

Technology Used

- Frontend: HTML, CSS, JavaScript
- Backend: Node.js, Express.js
- Database: MongoDB
- Design: Responsive CSS and media queries

Conclusion

The hardware store website successfully demonstrates a complete full-stack implementation with separate user and admin interfaces. The system allows efficient online shopping for users and simplified store management for administrators. The responsive design ensures accessibility across devices, making the platform suitable for real-world deployment.

Project Completion Status

All planned modules and features were successfully implemented and tested.
